

BizYangu OS — Shop PC Setup Guide

A step-by-step guide for setting up BizYangu OS on the shop's desktop computer.

Before you start, you'll need a USB flash drive with these two things on it: 1. BizYangu OS Setup 1.0.0.exe (the installer) 2. The project folder (used once, just to load the starting stock list)

Step 1: Install the app

1. Plug the USB drive into the shop computer.
 2. Copy BizYangu OS Setup 1.0.0.exe from the USB drive onto the shop computer's Desktop.
 3. Double-click it to run the installer.
 4. Follow the on-screen prompts (click Next → Install → Finish).
-

Step 2: Set up the shop

1. Open **BizYangu OS** from the Start Menu or Desktop shortcut.
2. You'll see a "Welcome to BizYangu OS" setup screen. Fill in:
 - **Shop name** — the real shop name
 - **Phone number**
 - **Address / location**
3. Click Continue, then fill in the admin account:
 - **First name / Last name** — whoever will be the main admin (owner/manager)
 - **Email**
 - **Password** — choose something the owner will actually remember and use daily. Write it down somewhere safe.
4. Click **Create shop**.

You should now see the main dashboard — empty for now, that's expected.

Step 3: Load the starting stock list

This loads ~100 common Kenyan retail/duka products (with realistic prices) so the shop doesn't start from a completely blank inventory.

Leave the BizYangu OS app open and running for this step — it needs to stay open the whole time.

1. Copy the project folder from the USB drive onto the computer (anywhere is fine, e.g. the Desktop).
2. If Node.js isn't already installed on this computer: download and install it from **nodejs.org** (choose the "LTS" version, click through the installer with default options).
3. Open a **Command Prompt** or **PowerShell** window (search for it in the Start Menu).
4. Type the following, pressing Enter after each line. Replace the path in the first line with wherever you actually put the project folder:

```
cd "C:\Users\YourUserName\Desktop\project"
npm install
```

Wait for this to finish (may take a few minutes, needs internet).

```
$env:DATABASE_URL =
"postgresql://biashara:biashara_local@127.0.0.1:55432/biashara"
npm run add-stock --workspace=@workspace/api-server
```

5. You should see a message like Added 81 products. — that's it, done.
 6. Go back to the BizYangu OS app window and check the **Inventory** page — the stock list should now be there.
-

Step 4: Clean up (optional but recommended)

Once Step 3 is done successfully, you no longer need Node.js or the project folder on this computer for everyday use — only the installed BizYangu OS app matters going forward. You can safely:

- Delete the project folder from the Desktop
 - Delete the installer .exe from the Desktop
 - Keep the USB drive somewhere safe in case you need to reinstall later
-

What's NOT included yet (set up separately later)

- **M-PESA payments** — currently in test/demo mode only. Real M-PESA needs a business Till Number from Safaricom plus additional setup.
 - **AI Business Advisor** — needs an API key added later once available.
-

If something goes wrong

- **App won't open / shows an error on startup** → close it, reopen it from the Start Menu, try again. If it keeps happening, note down the exact error message shown.
- **"Could not complete setup" during Step 2** → double check every field is filled in, especially the password (must be at least 6 characters) and email (must look like a real email address).
- **Stock list doesn't load in Step 3** → make sure the BizYangu OS app is open and running *before* running the `npm run add-stock` command.

For anything else, note the exact error message and get in touch.
